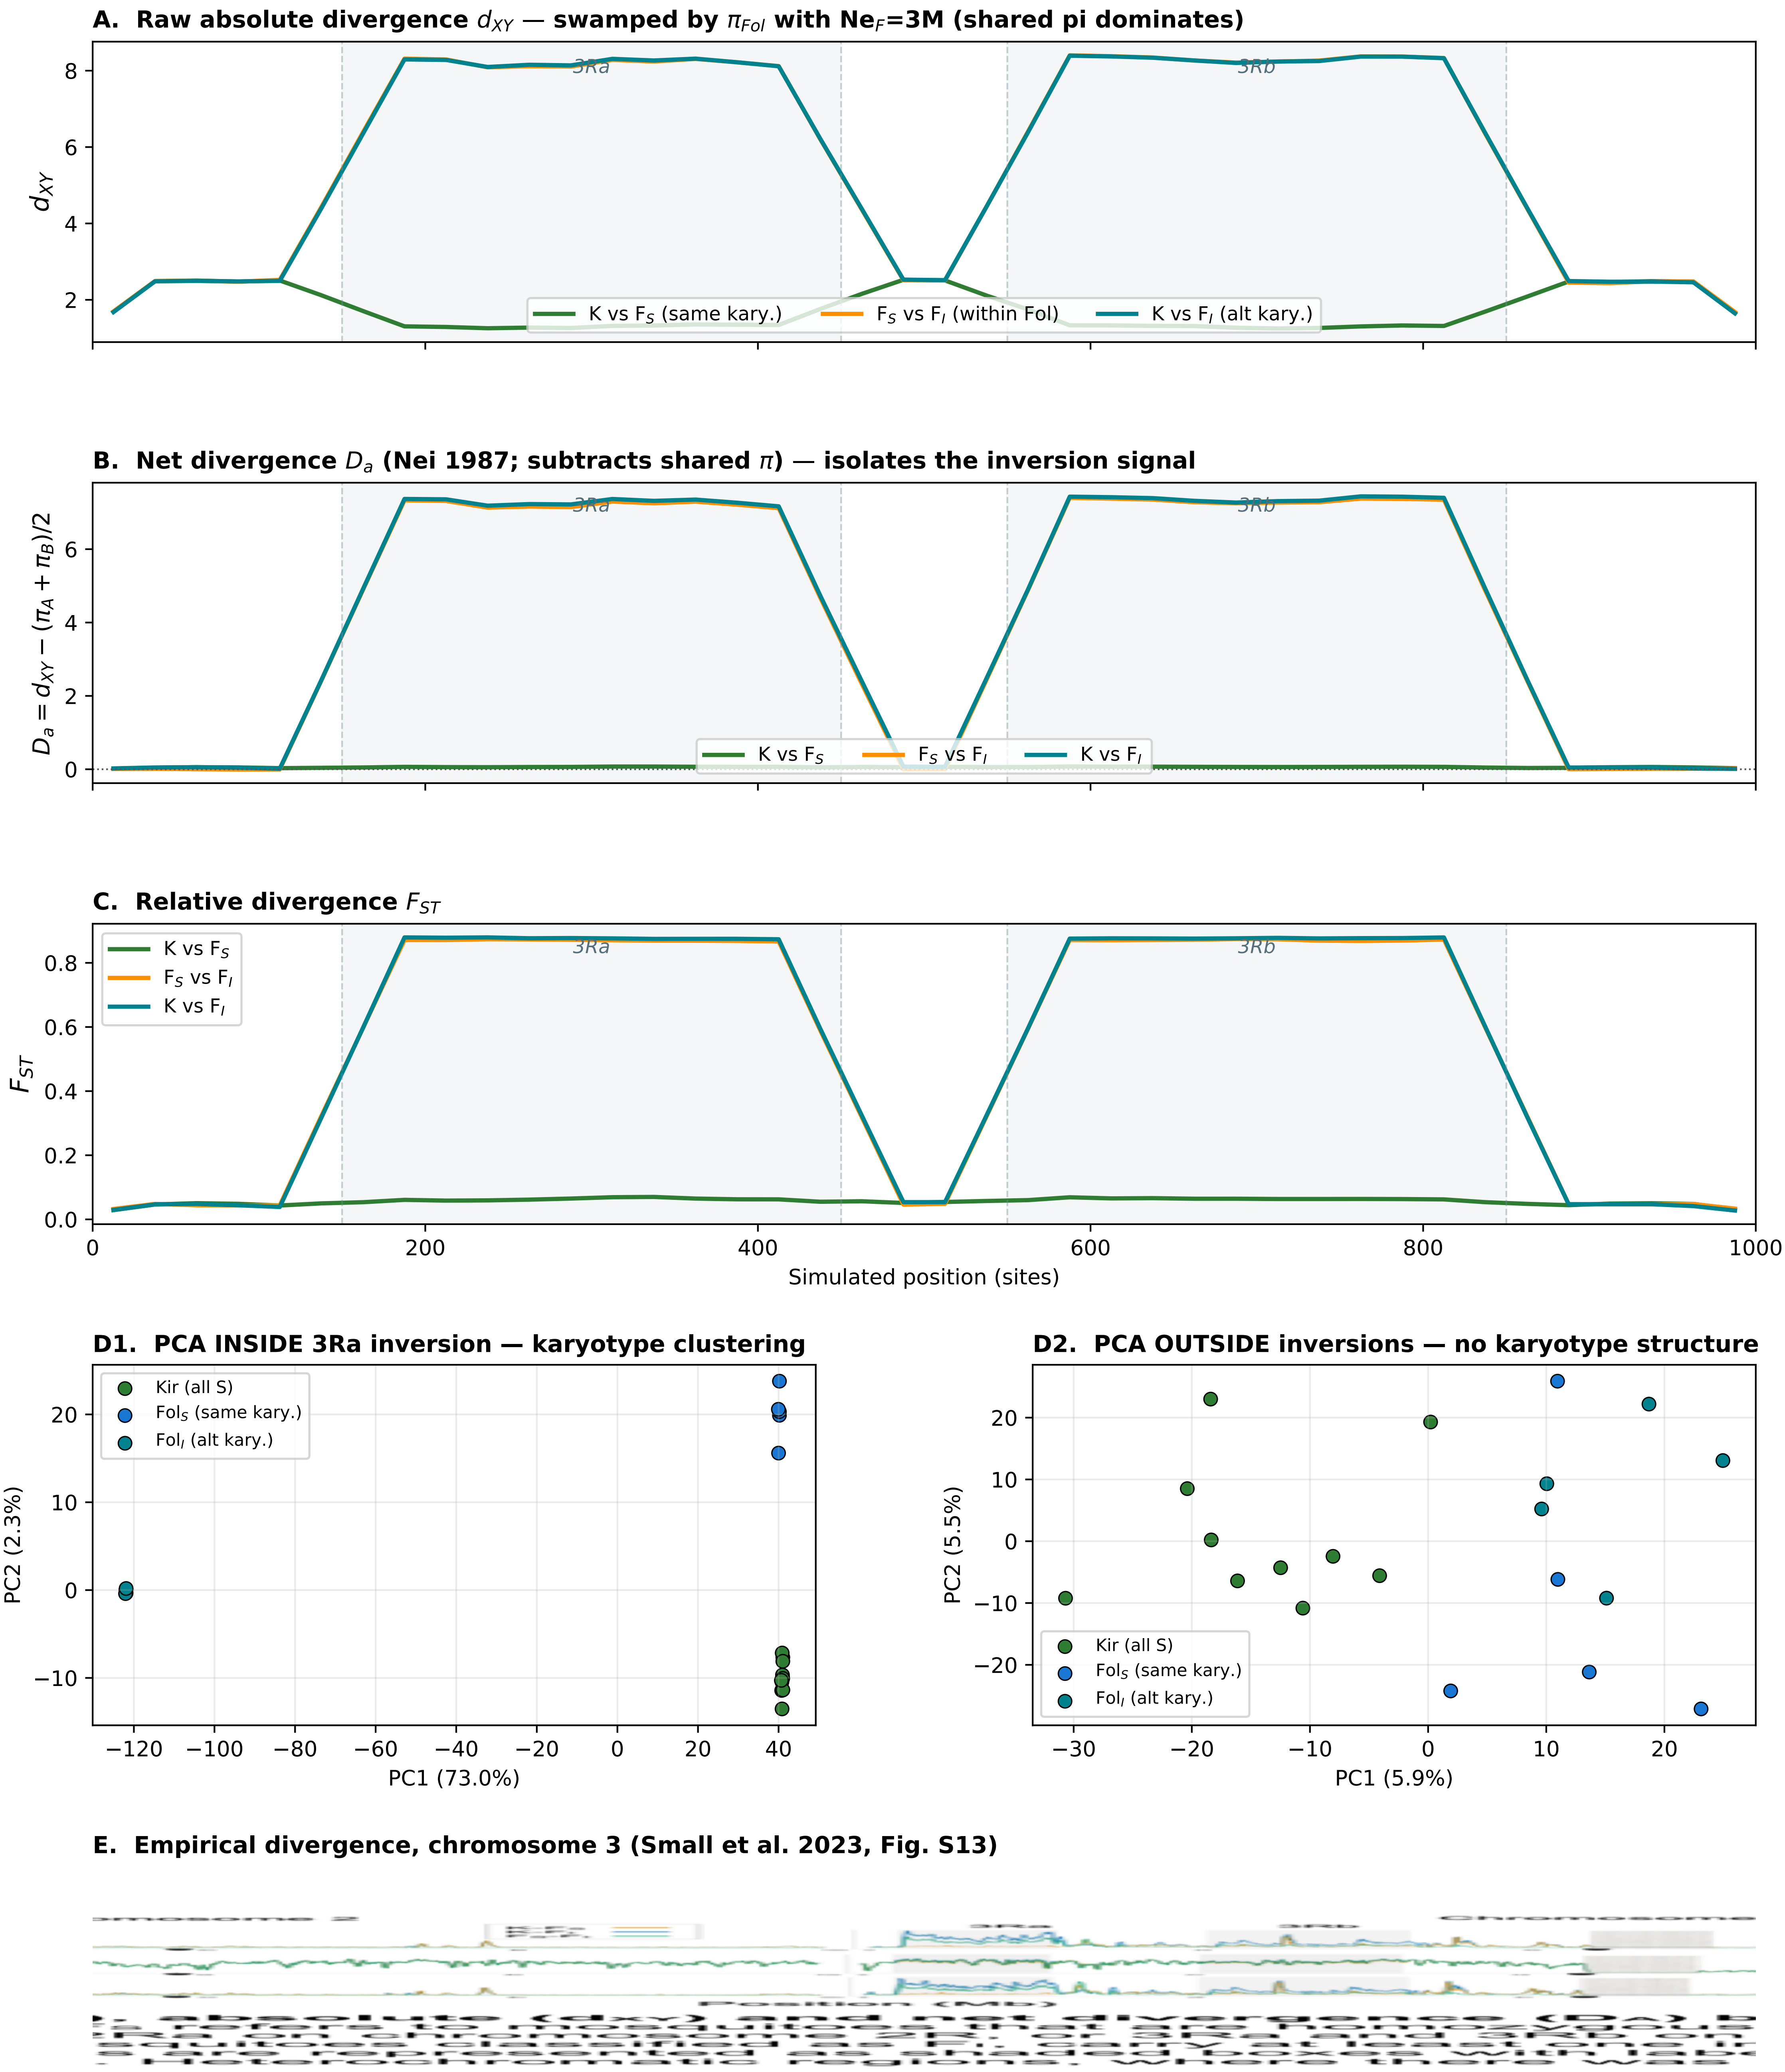
An. funestus: Kiribina vs Folonzo divergence at 3Ra + 3Rb inversions
msinv coalescent simulation with real demographic parameters



Parameters (Table S8): Ne_K=70,000, Ne_F=3,000,000, Ne_{Anc}=44,000 — EXTREME Ne asymmetry (ratio ~43x)
T_{split}=14,000 gen (~1,300 yr), T_{inv}~385,000 gen (~35 kyr). θ=62.5, ρ=704 (100 kb). Gene flux γ=0 (recombination modifier only). 300 replicates.
KEY INSIGHT: d_{XY} is swamped by high π_{Fol}. D_a (net divergence) recovers the inversion signal that matches empirical F_{ST} and PCA patterns.
