

# Scenario 1: SLIM vs msinv (hull)

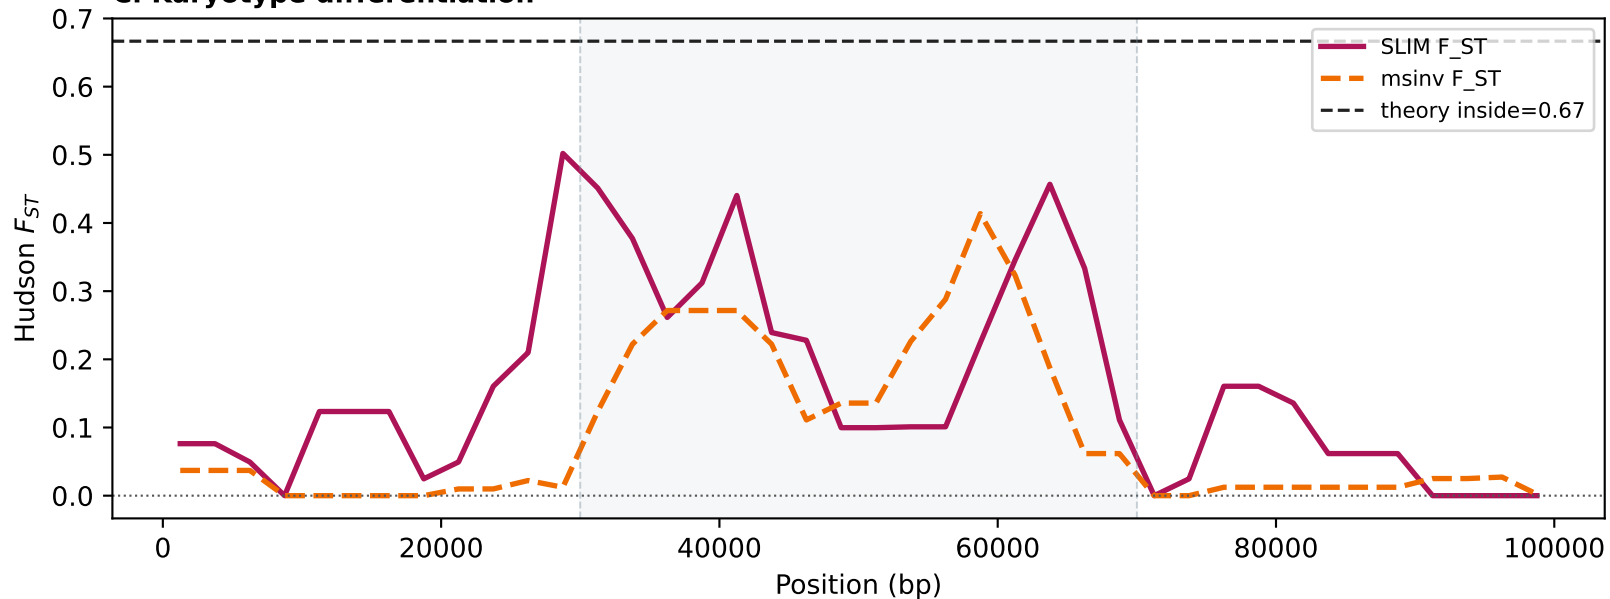

## A. Within-karyotype diversity (scenario 1, N\_reps=3)

## B. Between-karyotype divergence

## C. Karyotype differentiation

SLIM vs msinv validation, scenario 1.  $N_e=1000$ ,  $L=100$  kb,  $r=1e-07$ ,  $\gamma=1e-08$ ,  $\mu=1e-08$ ,  $t_{inv}=4000$  gen, burnin=8Ne. Runtime per rep: SLIM 22.4s, msinv 0.037s (speedup 599x). 10 S + 10 I haploid samples classified by inv 0 marker. Theory lines assume neutral coalescent with instant karyotype barrier at  $t_{inv}$  and no flux (upper bound for  $d_{xy}$  inside).
