

An. funestus: Kiribina vs Folonzo divergence at 3Ra + 3Rb inversions msinv coalescent simulation with real demographic parameters

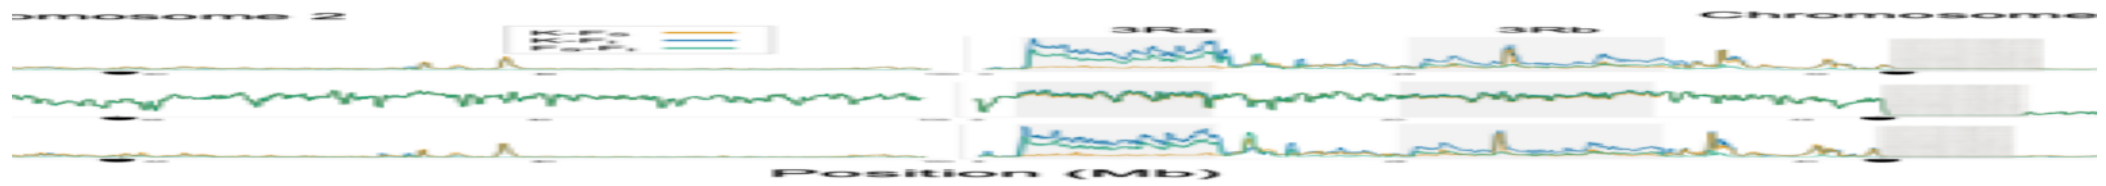

A. Simulated absolute divergence (d_{xy})

B. Simulated relative divergence (F_{ST})

C. Empirical divergence, chromosome 3 (Small et al. 2023, Fig. S13)

a, absolute (d_{xy}) and net divergence (D_A) b is refers to mosquitoes that are homozygous 3Ra on chromosome 2R, or 3Ra and 3Rb on squitoes classified as F_I , carry at least one F_I are represented as shaded boxes with labels. Heterochromatic regions, where there was

Parameters (Table S8): $N_{EK}=70,000$, $N_{EF}=3,000,000$, $N_{Anc}=44,000$
 $T_{split}=14,000$ gen ($\sim 1,300$ yr), $T_{inv}\sim 385,000$ gen (~ 35 kyr)
 $\theta=62.5$, $\rho=704$ (100 kb region), gene flux decoupled ($\gamma=0$, no effect on pattern)
 Kir: fixed homokaryotype, Fol: polymorphic ($p=0.3$), no migration (best-fit IIM), 300 replicates
