

Figure 3. msinv reproduces divergence patterns of real chromosomal inversions. Left: *An. funestus* 3Ra-like inversion ($N_e=10,000$, $\mu=3.55e-9$, $t_{inv}=100,000$ gen, $p_{inv}=0.3$). Right: Human MAPT H1/H2-like inversion ($N_e=10,000$, $\mu=1.2e-8$, $t_{inv}=100,000$ gen, $p_{inv}=0.2$). Top: d_{XY} , $\tilde{\pi}$, and D_a show elevated divergence inside the inversion. Bottom: Hudson F_{ST} shows relative differentiation. The deeper barrier and older age of 3Ra produce a stronger signal than MAPT. Parameters: $L=100$ kb, $r=1e-8$, $\gamma=1e-9$, 80 replicates per scenario.

Command: `pixi run -e all python examples/make_figures.py`
