

Figure 3. msinv reproduces divergence patterns of real chromosomal inversions. Left: *An. funestus* 3Ra-like inversion (Ne=10,000, $\mu=3.55\text{e-}9$, $t_{\text{inv}}=100,000$ gen, $p_{\text{inv}}=0.3$). Right: Human MAPT H1/H2-like inversion (Ne=10,000, $\mu=1.2\text{e-}8$, $t_{\text{inv}}=100,000$ gen, $p_{\text{inv}}=0.2$). Top: d_{XY} , $\tilde{\pi}$, and D_a show elevated divergence inside the inversion. Bottom: Hudson F_{ST} shows relative differentiation. The deeper barrier and older age of 3Ra produce a stronger signal than MAPT. Parameters: L=100 kb, $r=1\text{e-}8$, $\gamma=1\text{e-}9$, 80 replicates per scenario.

Command: `pixi run -e all python examples/make_figures.py`
