

A. Two independent inversions — cross-karyotype dXY

B. Hudson FST — each inversion elevates its own axis

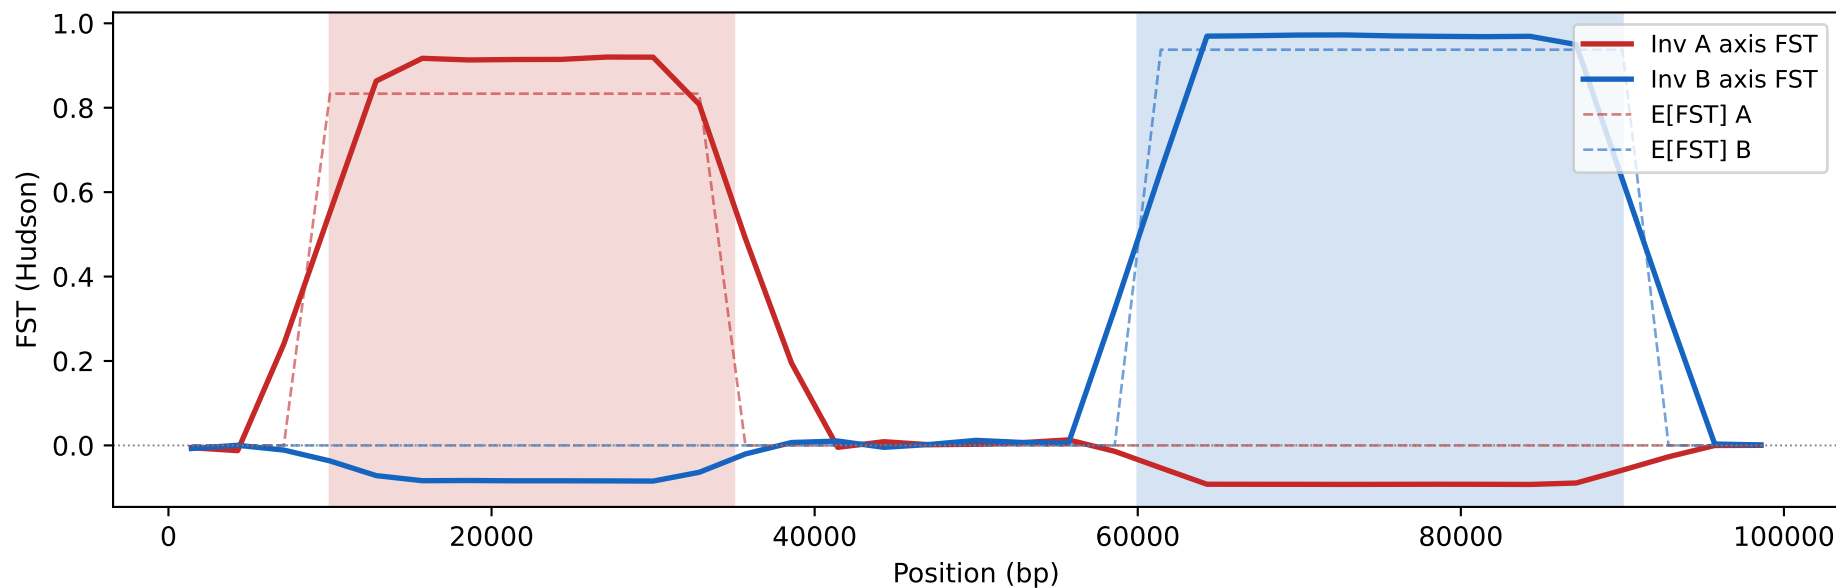

Figure 4. Two independent inversions on the same chromosome. Inv A (10-35 kb; $t_{inv}=100,000$ gen, $p_{inv}=0.5$). Inv B (60-90 kb; $t_{inv}=300,000$ gen, $p_{inv}=0.3$). (A) dXY elevated inside each inversion. (B) Hudson FST with theory predictions (dashed). Parameters: $N_e=10,000$, $L=100$ kb, $r=1e-8$, $\gamma=1e-9$, 80 reps.
Command: `pixi run -e all python examples/make_figures.py`
